Goal: Implement gesture recognition for development of drawing tool.

Secondary Goal: Image recognition of drawn material for categorization and gestures for image details.

THE PROBLEM

Research Question:

Can the Myo armband function as a preliminary drawing tool?

Drawing created from final deliverable.

Theoretical Protocol

The Myo Armband can classify gestures for classification, as well as use IMU data to draw!

01

Train classifier
model for gestures

Use
myo-emg-dataset
from Kaggle

02

Develop drawing
tool for sketching

Shape_capture
method, similar to
MS Paint

03

Incorporate gestures +
drawing tool to make
sketches with various
thicknesses

External: save basic
sketches to png
images

04: Future

Use protocol to
convert front, side
and top view to
isometric drawing

Benefit: construct images for preliminary
product conception

myo-eng-dataset:

- 5000 samples, 30 readings/sample
- Format: numpy ndarray [N, 30, 8] (#number of samples, readings per sample, channels)
- SVM model to train data, test sample size = 0.2, train sample size = 0.8

Result: overall accuracy of trained set is 0.92 (from prior model)

4 gestures used:

- A. 0-Neutral Gesture
- B. 1-Flexion
- C. 2-Extension
- D. 7-Fist

| Column 1 | Precision | Recall | f1-score | Gesture Count |
|----------|-----------|--------|----------|---------------|
| 0 | 0.89 | 0.96 | 0.92 | 558 |
| 1 | 0.94 | 0.86 | 0.9 | 187 |
| 2 | 0.97 | 0.86 | 0.91 | 187 |
| 7 | 0.96 | 0.91 | 0.93 | 187 |

Developed SVM model and used the result to predict the class of the most recent 30 samples in real time.

Real-time data needed to be `abs()` and multiplied by 10 to match training data.

Results: Videos

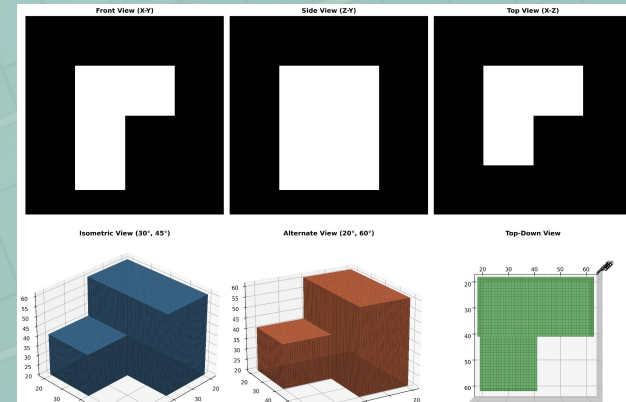

Future application:

Three view sketch (gesture used to change view), automatically converted to isometric view

Tools:

1. Numpy, store 3D coordinates
2. Matplotlib: 3D plotting (mpl_toolkits.mplot3d), Poly3DCollection for 3D faces

Thank you
